Profile

Software Engineer with 2+ years of production web-development experience. Most of my recent work is Python/Django backend, PostgreSQL, CRM and data integrations, search, document flows, and production fixes. I have worked on Kivi/OviPro/HubSpot data around 200k contacts, including identity matching and reconciliation where a wrong merge can look valid until it reaches a user. I also work with React, Next.js, TypeScript, and HTMX when a feature needs frontend work.

Before software I spent 8+ years in agriculture, agribusiness, greenhouse and food production, accounting, and sales. That background is especially useful for AgTech and other software tied closely to day-to-day operations.

~200k multi-source CRM/contact records	3 sources Kivi · OviPro · HubSpot	3.5s → ~300ms key search-flow improvement
--	---	---

Tools I use

- Backend:** Python, Django, Django REST Framework, Wagtail, REST APIs, C# / ASP.NET Core
- Data & integrations:** PostgreSQL, SQL, Django ORM, CRM sync, reconciliation, identity matching, import jobs, external APIs, caching
- Frontend:** React, Next.js, TypeScript, JavaScript, HTMX, Tailwind CSS, semantic HTML/CSS
- Testing & delivery:** Django tests, Playwright, Vitest, Ruff, mypy, GitHub Actions, Docker, CI/CD, production debugging
- AI features:** LLM APIs, prompt/output checks, retries, fallback logic, user confirmation where needed

Professional experience

Selected software roles

Software Developer · Techco / Bo
Finland

May 2025 – Present

- Built and maintained a CRM golden customer view across Kivi, OviPro, and HubSpot at roughly **200k-record scale**. Ambiguous identity matches go to review instead of being merged automatically.
- Worked on customer, property, and document synchronization. When data was missing or stale, I checked the source records and affected scope first, then changed the sync logic after the cause was clear.
- Cut one search path from **3.5s to ~300ms** by changing the query structure, relationship loading, candidate limits, and caching.
- Resolved **~1,600 duplicate assignment records** and tightened the ingestion rules so the duplicates would not return on the next sync.
- Shipped Django/Wagtail/DRF, PostgreSQL, HTMX, JavaScript, Tailwind, PDF/document, external API, and AI-assisted features in the same product.
- For risky sync and data changes, used tests, dry runs, real data checks, and rollback steps before turning the new behavior on.

Software Developer · Duotone
Remote

Feb 2025 – May 2025

- Built SaaS features with Next.js and TypeScript, including reusable UI and PostgreSQL/Supabase workflows, and prototyped full-text and semantic search.

Software Developer Intern · Nidos Ltd.
Turku, Finland · Internship via the BearIT LearnIT programme

Aug 2024 – Nov 2024

- Built CRM screens with React and TanStack Query/Table, connected them to REST APIs, handled loading/error edge cases, and added Playwright E2E tests.

Earlier software experience

Software Developer Trainee · BearIT Oy (LearnIT)

Mar 2024 — Nov 2024

Tampere, Finland

Full-stack project work with Next.js, TypeScript, tRPC, Prisma, authentication, testing, deployment, AWS basics, Agile/Scrum, and Finnish work-life training. The programme ended with the Nidos Ltd. internship listed above.

Frontend Developer · Upwork

Jul 2023 — Mar 2024

Remote · Freelance

React interfaces, REST API integration, loading/error states, mobile layouts, and basic accessibility work for freelance clients.

Selected engineering projects

[All repositories ↗](#)

Cultural Currency Converter

[Django](#) · [PostgreSQL](#) · [HTMX](#) · [Redis](#)

A travel-money app with current and historical FX rates. It keeps the source and effective date visible, and the core conversion still works when optional AI or enrichment providers are unavailable.

DomoNest

[Python](#) · [Django](#) · [Wagtail](#) · [PostgreSQL](#)

A Django household app where pantry, recipes, shopping, and recurring tasks share data. Database constraints and derived views keep those features from drifting apart as the app grows.

JunaLippu

[Next.js](#) · [TypeScript](#) · [tRPC](#) · [Prisma](#)

A Finnish rail-booking demo where seat availability is tracked by route segment. A database constraint protects against two users booking the same segment at the same time.

Shopping Budget Companion

[React](#) · [TypeScript](#) · [Zod](#) · [PWA](#)

A local-first shopping budget PWA. Money is stored in integer minor units, browser data is versioned, and barcode/OCR/image recognition can suggest a value but cannot add it to the cart without confirmation.

How I work

- When production data looks wrong, I check the source records and trace the flow before changing code.
- I keep uncertain identity matches out of automatic merges and send them to review instead.
- I try to make sync and import jobs safe to run again after a partial failure.
- I prefer the existing framework and a small change over adding another service or library without a clear need.
- For AI features, model output is checked before it can affect business data or user-facing limits.

Education

MSc Software Engineering [In progress](#)

National Technical University “Kharkiv Polytechnic Institute” · Sep 2026 — Present

Junior Specialist · Agronomy

Novy Buh Agrarian College · 2016 — 2019

Master’s Degree · Accounting & Auditing

Mykolayiv National Agrarian University · 2007 — 2012

Selected software training: BearIT LearnIT · Codecademy Full-Stack Engineer · Harvard CS50 coursework

Domain background

8+ years across agriculture, agribusiness, greenhouse and food production, accounting, sales, and customer-facing work. It helps when software has to fit an actual operating process rather than a clean diagram.
